Assignment 1 - Git & GitHub Fundamentals Report

• Full Name: Rania Rahoui

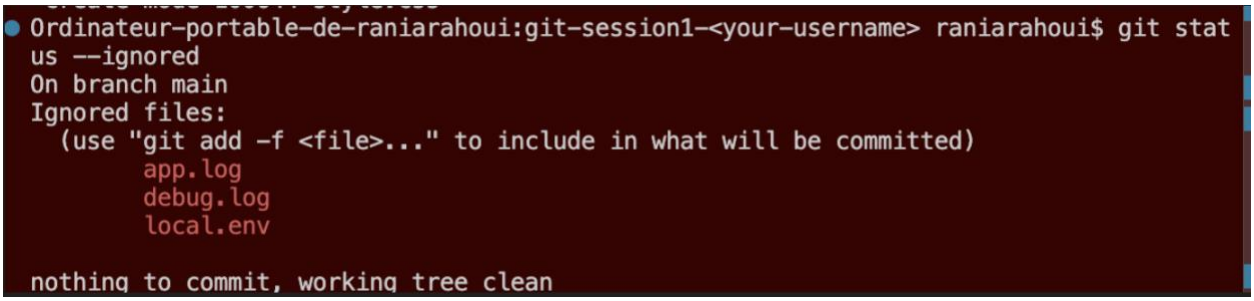

• Student ID: 161538

• Course Code & Section: 3324 02

• GitHub Username:rania-rahoui

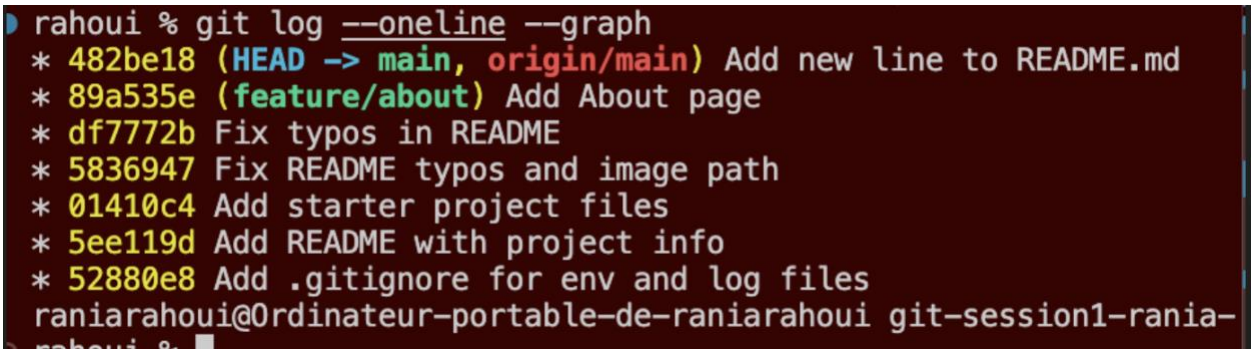

1.**Repository Setup**

I created a folder named git-session-rania-rahoui with the starter files and ran git init and git branch -M main. In .gitignore I ignored loval.env and all log files with *.log, then added !important.log so important.log stays tracked. I checked it with git status –ignored, which listed app.log, debug.log and local.env as ignored.

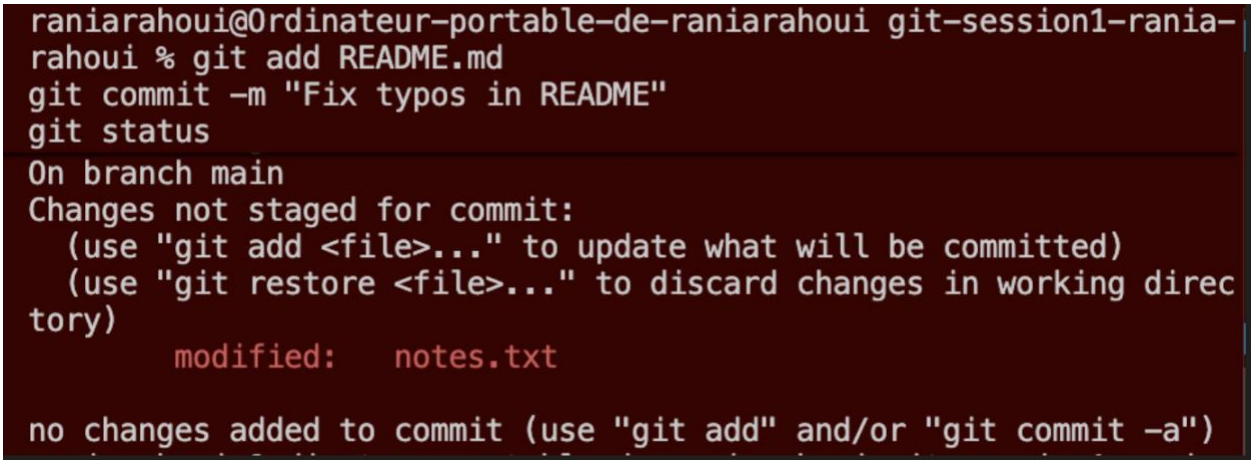

2. README & Commit History

My README has my name, username, a short description, the technologies, a code block with basic Git commands, a link to the Git documentation since I didn't know what kind of link we needed to add, and the project banner image from the assets folder. I kept each commit small, with one change per commit: the .gitignore, the README, the starter files, some README fixes since I did make some mistakes, the About page, and the notes update.

3. Selective Staging

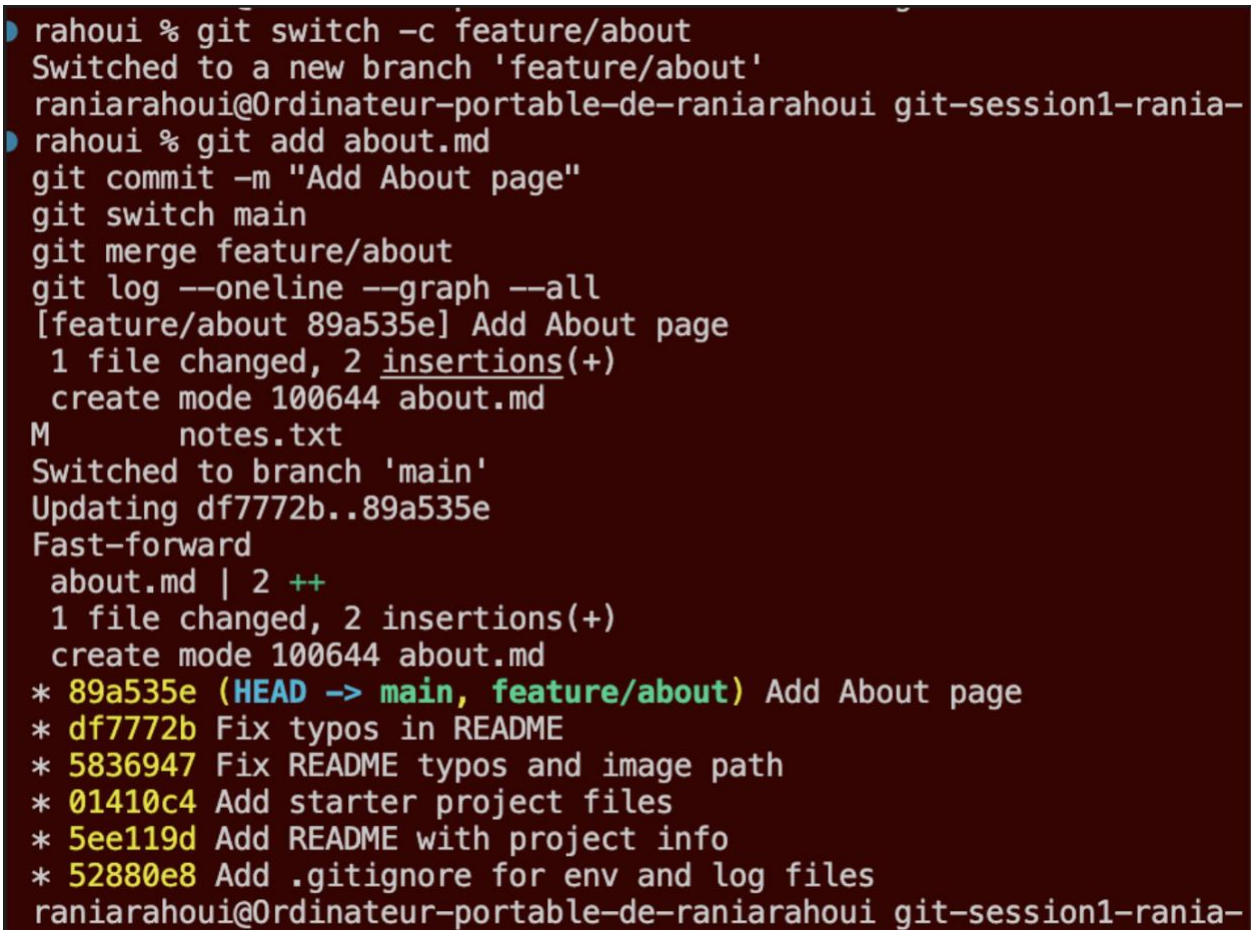

I realized that I made some typos in README.md so I fixed those and added a line to notes.txt at the same time. I ran git add README.md only, then committed. Git status showed notes.txt still modified and not staged. I used it later for git diff and git diff –staged.

4. Branch & Merge

I created a branch with git switch -c feature/about, added about.md, and committed it there. Then I went back to main and ran git merge feature/about. It was a fast-forward merge, because main had no new commits, so Git just moved main forward to the feature

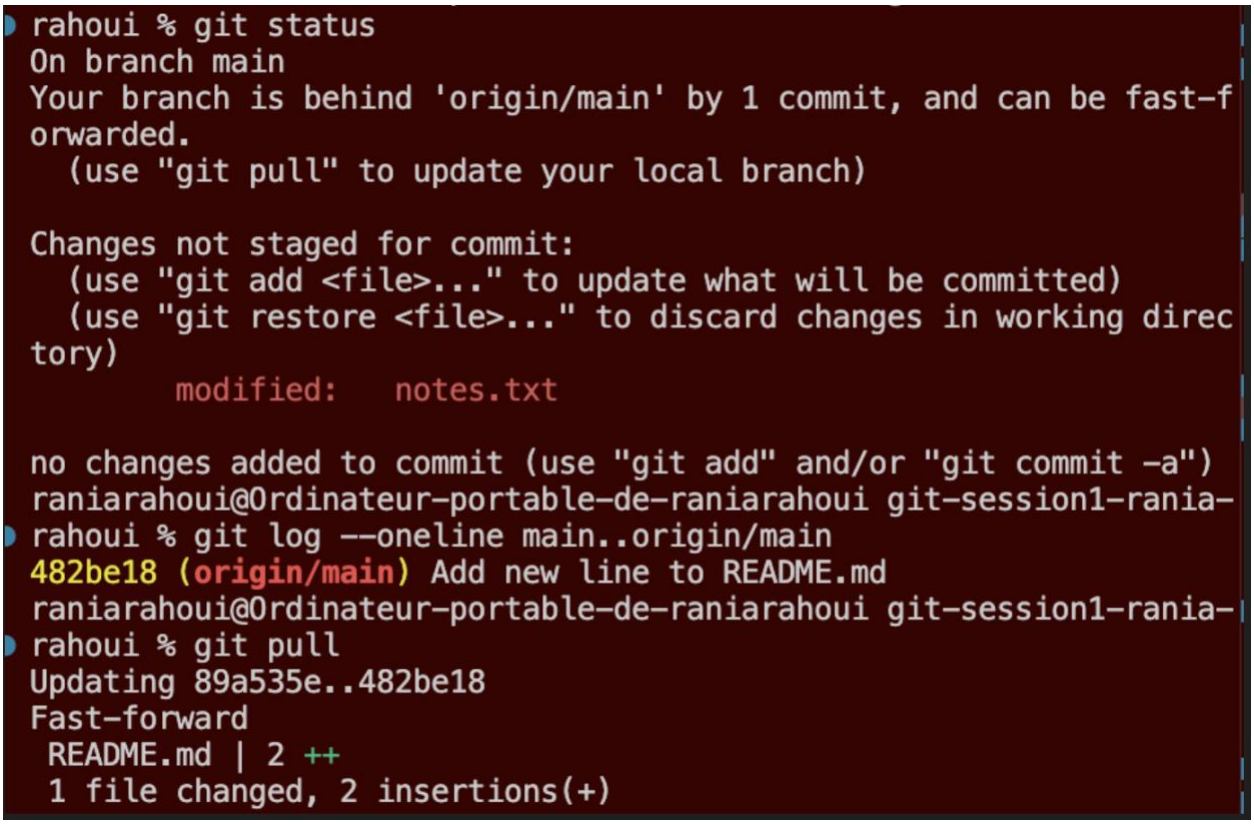

commit. The log shows main and feature/about on the same commit.

5. Remote Changes

A commit saves a snapshot of my changes in my local repository, while push sends my local commits to GitHub. Fetch downloads new commits from GitHub without changing my files. After I edited the README on Github, git fetch followed by git status showed my branch was behind origin/main by 1 commit. Pull does a fetch plus a merge, so after git pull

the new line appeared in my local README.

6. Fair Use of AI

I used Claude as a step-by-step guide while doing the lab. I asked it for help when something wen wrong. For example, I renamed my folder while VS was open, and my edits stopped reaching the repository. I typed every commend myself and checked the results each time with git status and git log. I made sure to understand what each command does.

7. Sources & Reflection

Sources: The session1 practice, Git documentation, And Claude

The hardest concept for me was the difference between fetch and pull and seeing that fetch updates origin/main without touching my files. And another hard thing would be using the right commends.
